System i Modernization

System i Modernization

Barry-Wehmiller International Resources (BWIR) is part of the consulting group of Barry-Wehmiller Companies, Inc. a diversified company founded in 1885. With headquarters in St. Louis, Missouri and primary operations in India, BWIR offers the combined benefits of the proximity and dependability of a US company with the affordability of distributed development centers.

System i modernization is high on the priority list of most IT professionals in traditional System i shops. Reasons include pressure from users, a corporate directive or an IT initiative. While some IT shops want to retain as much of the investment on the System i as possible during the modernization phase, others are looking to migrate to alternate platforms.

BWIR is the premier service provider in the System i modernization space. Our System i experience starts with the inception of the AS/400 platform in the early 90's. Additionally, through our relationship with Microsoft, we are recognized as a leader in .Net development. BWIR has developed partner relationships with many of the tool vendors in this space and our consultants are experts in these tools. We have evolved a proprietary modernization methodology that is focused on preserving legacy assets.

Services

BWIR offers a comprehensive suite of services that include:

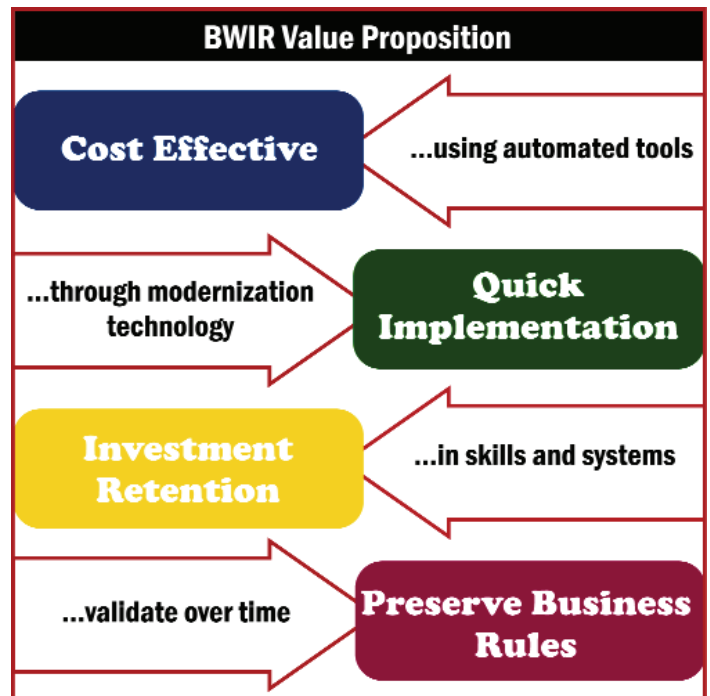

- Application modernization using tools - Automated tools will be used to convert the existing source code written in System i languages into either Microsoft or Java platform
- Application modernization through re-engineering - Complete re-write of the application with business process changes and added functionality

- Integration - Legacy applications are integrated to modern applications such as E-Commerce and Business Intelligence tools
- User interface enhancements - Options include upgrading the green screen application without modifying the underlying code or implementing a client-server front-end application

Modernization Methodology

Through our experience spanning multiple complex modernization initiatives, BWIR has developed a proprietary methodology that includes the following phases:

- Phase I: Assessment. Complete system study to project cost, effort and timeline.
- Phase II: Proof of Concept (PoC). Validate the feasibility of the modernization effort using the selected tool.
- Phase III: Project planning. Publish the work break down.
- Phase IV: Execution through our proven project management methodology.
- Documentation and training of users and IT staff at each phase.
